

TOP 5 QUALITIES OF A JURISDICTIONAL ENGINEERING INSPECTOR

What to look for when choosing a jurisdictional engineering inspector for your facilities

1

OWNERSHIP

All boiler and pressure vessels must be maintained in accordance with applicable codes and regulations such as The National Board Inspection Code, Pressure Equipment Directives (EU Standard), local jurisdictions, and many others. Your Engineer should take ownership of the inspection needs to assist you in maintaining compliance with applicable regulations.

2

INTEGRITY & TRUST

A trusted Inspector abides by all codes and achieves excellence through all of their work. Clients need to trust their inspectors to have confidence in the services and information provided.

This integrity and trust allows for a positive working relationship to develop between the client and the engineer.

3

EXPERIENCE

With experienced inspectors by your side, you can be assured that they are following all codes, standards, regulations, and local jurisdictions. Experienced staff are able to check on and maintain all operational/jurisdictional certificates for facilities, which comes from an experienced and reliable professional.

4

ATTENTIVENESS

Inspectors should be ready to rush orders, e.g. during limited manufacturer time, and consistently work to adjust and provide information to aid clients in saving expenses. This attentiveness allows for effective communication, ease of providing information and immediate feedback to the facility.

5

EXTENSION TO YOUR PROGRAM

Owners and manufacturers should utilize their inspectors as an extension of their program. Your inspectors are there to openly share their experience, knowledge, ideas, and suggested recommendations to help improve and streamline processes at your facilities. This close working relationship provides overall benefits beyond an ordinary Jurisdictional Engineering Inspector.

How you view your Third-Party Inspection Agency could be a direct result of how your inspector measures up on each of these top qualities. How does your third-party Jurisdictional Engineering Inspector measure up?
